Recap: the linear view of drug discovery

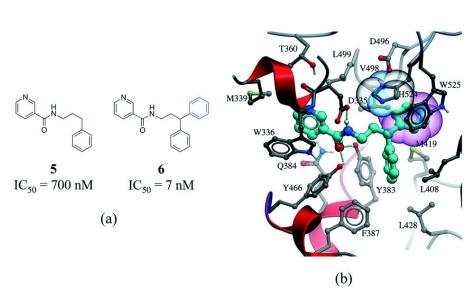

Adapted from Paul *et al.* "How to Improve R&D Productivity: The Pharmaceutica Industry's Grand Challenge." Nature Reviews Drug Discovery, 2010

One goal of target-based drug discovery: to make a molecule that binds specifically and strongly to the target protein

a) Chemical structure of two inhibitors of human soluble epoxide hydrolase (sEH); b) X-ray cocrystal structure of human sEH and 6 (cyan carbons, PDB: 3l1Y). The phenyl ring (transparent CPK magenta) is positioned to allow a π -stacking interaction with H524 (shown as transparent CPK). Hydrogen bonds are displayed in dotted green lines.

Freitas, R. F. de & Schapira, M. A systematic analysis of atomic protein–ligand interactions in the PDB. Med. Chem. Commun. 8, 1970–1981 (2017)

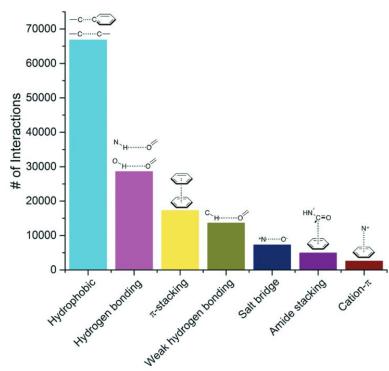

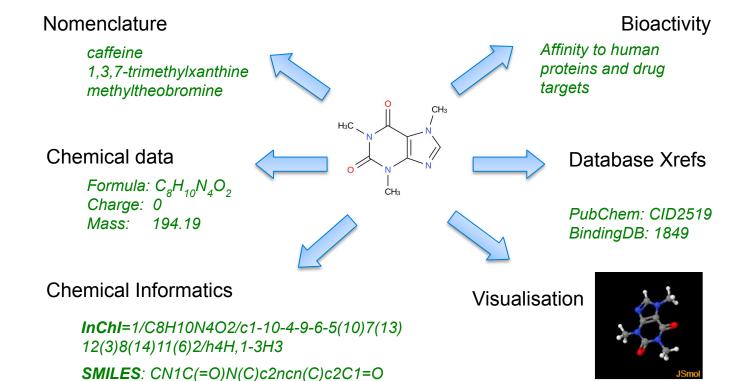

Fig. 1 Frequency distribution of the most common non-covalent interactions observed in protein-ligands extracted from the PDB.

ChEMBL is an information source of small molecules

A subset of available information from EBI ChEBI/ChEMBL, inspired by EBI's roadshow *Small Molecules in Bioinformatics*

UNI

Representation of small molecules

- Simplified Molecular-Input Line-Entry System (SMILES)
- IUPAC International Chemical Identifier (InChl)
- InChiKey: a 27-character, hash version of InChI
- Molfile: a type of <u>chemical table files</u>

Molecular descriptors: numeric values that describe chemical molecules

In contrast to symbolic representations, molecular descriptors enable quantification of molecular properties.

Molecular descriptors allows mathematical operations and statistical analysis that associate biophysical or biochemical properties with molecule structures.

- -Atom count
- -Molecular weight
- -Sum of atomic properties
- -Fragment counts, e.g. # of -OH
- -Fingerprints
- -Topological descriptors, e.g. the Wiener Index based on graph theory
- ECFP

- -Geometrical
- -Atomic coordinates
- -Energy grid

-Combination of atomic coordinates and sampling of possible conformation

S

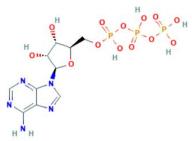

Selected commonly used molecular descriptors

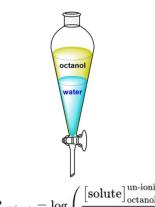

Molecular Weight (MW). for example, adenosine triphosphate (ATP), the energy molecule, has a MW of 507.

logP (partition coefficient) quantifies the hydrophilicity and hydrophobicity of a molecule. The calculated version (cLogP) exists as well.

While logP is independent of pH, logD measures the pH-dependent lipophilicity of ionizable molecules.

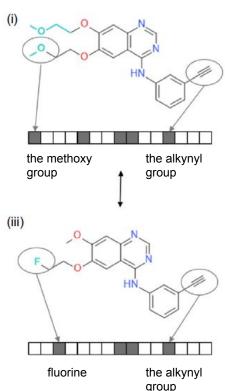

$$\log P_{
m oct/wat} = \log \left(rac{\left[
m solute
ight]_{
m octanol}^{
m un-ionized}}{\left[
m solute
ight]_{
m water}^{
m un-ionized}}
ight)$$

Molecular fingerprints: a set of techniques to represent molecules in a bit array.

The Tanimoto coefficient, similar to Jaccard Index, makes it easy to compare molecules pairwise.

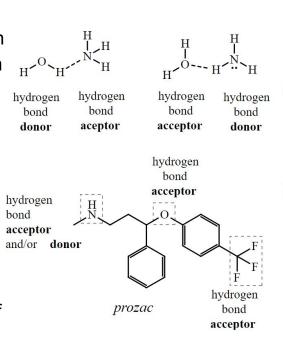

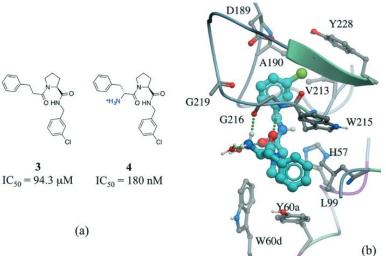

Number of hydrogen bond acceptors and donors are important descriptors, too

A hydrogen bond: an electrostatic force of attraction between a hydrogen (H) atom which is covalently bonded to a more electronegative "donor" atom or group (Dn), and another electronegative atom bearing a lone pair of electrons—the hydrogen-bond acceptor.

Hydrogen bonds (H-bonds) both influence the structure of the molecule and its binding to the target.

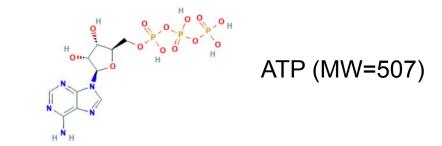

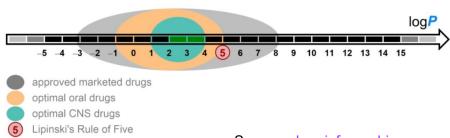

Effect of adding a hydrogen bond in a thrombin inhibitor: a) chemical structure of a pair of thrombin inhibitors; b) crystal structure of molecule 4 (cyan carbons) in complex with thrombin (PDB: 2ZC9). Hydrogen bonds are displayed in dotted green lines.

Lipinski's Rule of Five of small-molecule drugs

- HBD<=5: No more than 5 hydrogen-bond donors, e.g. the total number of nitrogen—hydrogen and oxygen—hydrogen bonds.
- HBA<=10: No more than 10 hydrogen-bond acceptors, e.g. all nitrogen or oxygen atoms
- MW<500: A molecular weight less than 500 Daltons, or 500 g/mol.
- logP<=5: An octanol-water partition coefficient (log P) that does not exceed 5. (10-based)

Target and its protein structure

QSAR= quantitative structure activity relationship; MoA= mechanism of action, or mode of action

Things you need to start a target-based drug discovery program

- 1. Indication and patient profile
- 2. **Protein target of interest**, *e.g.* evolutionary conservation, isoforms, expression profiles, structure, effect of modulation, *etc.*
- 3. **Modality**, shall we use small molecule, large molecule, antisense oligonucleotides or gene therapy? Shall we activate the target or inhibitor it? ...
- 4. Tool compounds and competitor information, if available
- 5. Target (ideal) profile of your drug
- 6. **Material for the campaign**: enough amount of proteins, compounds, etc.

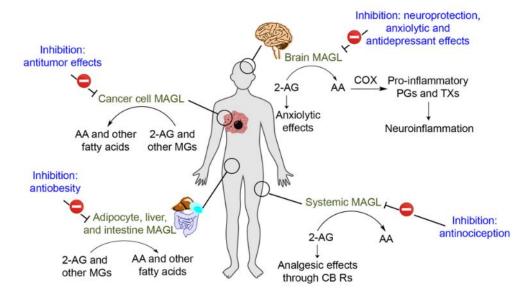

Protein MAGL (MGLL) is a key protein linking metabolism and inflammation that may be therapeutically exploited

The MAGL protein, known as monoglyceride lipase, is encoded by the MGLL gene in human. MAGL is a key enzyme in the hydrolysis of the endocannabinoid 2-arachidonoylglycerol (2-AG). It converts 2-AG into arachidonic acid (AA) and glycerol.

MAGL has been proposed as a potential target for many diseases. However, there has been no approved drugs targeting MAGL.

Figures above: Gil-Ordóñez et al., Biochemical Pharmacology, 2018

A drug candidate, BIA 10-2474, which targets a closely related protein, fatty acid amide hydrolase (FAAH), <u>caused serious adverse events in trial participants</u>, <u>leading to death of one man, in Rennes</u>, <u>Frances</u>, <u>2016</u>. The event has complicated the development of other drugs targeting the endocannabinoid system.

12

Things you need to start a target-based drug discovery program

- 1. Indication and patient profile: Multiple sclerosis (among others)
- 2. Protein target of interest: MAGL
- 3. **Modality**: small-molecule inhibitor
- 4. Tool compounds and competitor information: patents, publications, etc.
- 5. Target (ideal) profile of your drug: reversible, selective, brain penetrating
- 6. Material for the campaign: ready

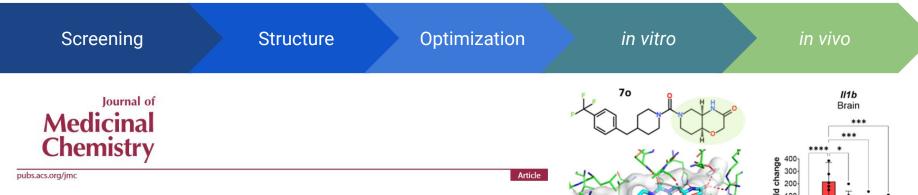

Key steps in lead identification (LI) and lead optimization (LO)

Screening	Structure	Optimization	In vitro	In vivo
Identify molecules (hits and leads) that bind to and modulate the target protein	Determine the mode of binding between the lead molecule and the target	Optimize the potency, selectivity, and physico-chemical properties of the molecule	Evaluate pharma- cology, ADME, and safety profiles of the molecule in vitro	Evaluate pharmacology , ADME/PK, and safety in animals (or alternative systems)

Example: Identification of a novel, reversible MAGL inhibitor with high potency and selectivity, and excellent absorption, distribution, metabolism, and excretion (ADME) properties

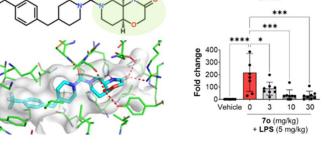

Structure-Guided Discovery of cis-Hexahydro-pyrido-oxazinones as Reversible, Drug-like Monoacylglycerol Lipase Inhibitors

Bernd Kuhn,* Martin Ritter, Benoit Hornsperger, Charles Bell, Buelent Kocer, Didier Rombach, Marius D. R. Lutz, Luca Gobbi, Martin Kuratli, Christian Bartelmus, Markus Bürkler, Raffael Koller, Paolo Tosatti, Iris Ruf, Melanie Guerard, Anto Pavlovic, Juliane Stephanus, Fionn O'Hara, Dennis Wetzl, Wiebke Saal, Martine Stihle, Doris Roth, Melanie Hug, Sylwia Huber, Dominik Heer, Carsten Kroll, Andreas Topp, Manfred Schneider, Jürg Gertsch, Sandra Glasmacher, Mario van der Stelt, Andrea Martella, Matthias Beat Wittwer, Ludovic Collin, Jörg Benz, Hans Richter, and Uwe Grether*

high MAGL potency

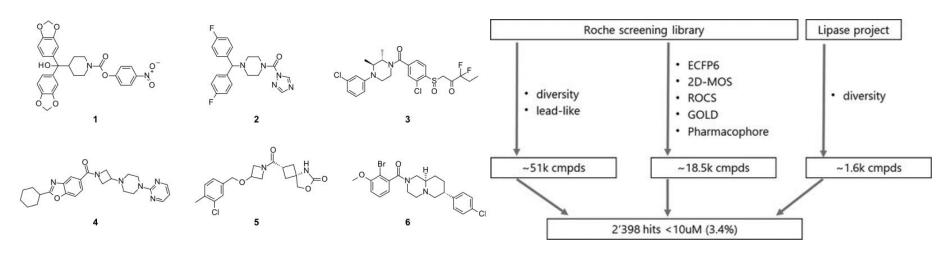

excellent selectivity

drug-like ADMET properties in vivo efficacy

Kuhn, B. et al. Structure-Guided Discovery of cis-Hexahydro-pyrido-oxazinones as Reversible. Drug-like Monoacylglycerol Lipase Inhibitors, J. Med. Chem. 67, 18448-18464 (2024).

Starting point: a library of compounds that may modulate the target

Left: selected published compounds targeting MAGL protein. Right: library assembly

<u>ECFP6</u>: extended connectivity fingerprints, diameter of bond distance 6, using compounds extracted from existing MAGL patents as references

<u>2D-MOS</u>: two-dimensional graph-based maximum overlapping spheres similarity search

ROCS: three-dimensional shape-based similarity search

GOLD: Docking program

<u>Pharmacophore</u>: molecular features that necessary for molecular recognition between ligand and target

Screening hit 7a and early optimizations

The hit 7a (benzoxazinone) was selected because of the high *ligand efficiency* (LE).

Ligand efficiency is defined as the binding energy (ΔG) divided by the number of non-hydrogen atoms. The binding energy is a function of IC₅₀: higher affinity means larger absolute value of the binding energy.

The co-structure of 7a and human MAGL protein was soon solved with X-ray crystallography (see right). The structure, when compared with the co-structures of other compounds, helps to guide medicinal chemists' work to optimize the molecule.

Compound	R	MAGL inh. (IC50, μM) ^a	$\begin{array}{c} MAGL \\ pIC_{50} \pm SD^b \end{array}$	LEe	$log D^d$	Solubility ^f [µg/mL]
7a		0.075	7.13 ± 0.08	0.38	3.2	1.1

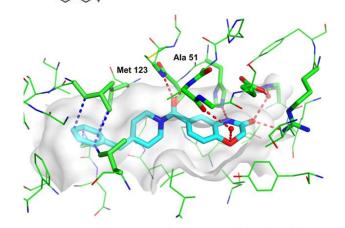

Figure 3. Co-crystal structure of human MAGL (green) with focused screening hit 7a (cyan, pdb code: 9F8A). Residues of the oxyanion hole (Ala51 and Met123) which are on top of the catalytic Ser122 are labeled. Hydrogen bonds between the ligand and the protein or water are shown as red, dashed lines. Dispersion interactions with short distances (<4.0 Å) in the hydrophobic pocket on the left are highlighted as blue lines. Water molecules are removed except for the ones that form hydrogen bonds with the ligand.

Further optimizations guided by structures, experiments, and machine learning predictions

Medicinal chemists, computer-aided drug design (CADD) experts, structural biologists and other colleagues worked together to build hypotheses about which changes may improve potency and ADME properties.

They synthesized new compounds, solved more structures, comparing structures and activities, thereby gaining insights in structure-activity relationship (SAR).

Biomarker study confirms a brain-specific anti-inflammatory effect

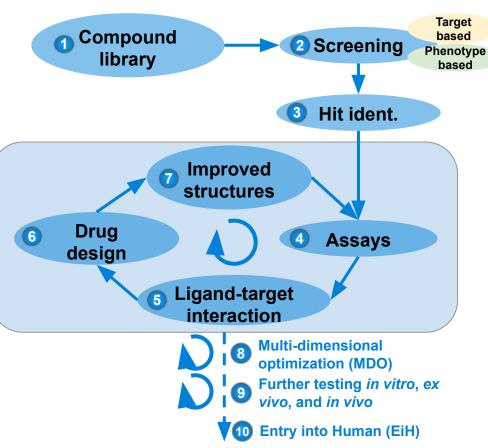

Efficacy of the compound 70 in the LPS (lipopolysaccharide) model of neuroinflammation. Mice were dosed with vehicle, LPS, or LPS + 70 (3, 10, 30 mg/kg intraperitoneal). mRNA analyses of the lcn2 gene (lipocalin-2) and the II1b (interleukin 1-beta) demonstrated the anti-inflammatory properties of compound 70 specifically in the brain, not in liver.

Workflow in a typical target-based drug-discovery program

- Compound library construction (small molecules, large molecules, RNA therapeutics, or other modalities)
- Screening compounds with bioassays, or assays, which determine potency of a chemical by its effect on biological entities: proteins, cells, etc;
- 3. Hit identification and clustering;
- More assays, complementary to the assays used in the 4. screening, maybe of lower throughput but more biologically relevant:
- Analysis of ligand-target interactions, for instance by getting the co-structure of both protein (primary target, and off-targets if necessary) and the hit:
- Drug design, namely to modify the structure of the drug 6. candidate:
- 7. Analog synthesis and testing (back to step 4);
- 8. Multidimensional Optimization (MDO), with the goal to optimize potency, selectivity, safety, bioavailability, etc;
- 9. Further *in vitro*, *ex vivo*, and *in vivo* testing, and preclinical development;
- Entry into human (Phase 0 or phase 1 clinical trial). 10.

24

Summary

- Target-based drug discovery relies on screening, structure information, and iterative optimization to identify drug-like molecules.
- 2. Drug-like molecules are tested *in vitro* and *in vivo* to ensure their pharmacological, ADME, and safety profiles.
- Chemoinformatics, computer-aided drug design, and machine learning play important roles in lead identification and optimization.

Free training opportunity offered by U.S. Food & Drug Agency: FDA Clinical Investigator Training Course 2024

The primary goal of this clinical investigator training course is to provide participants with the essential knowledge and skills to conduct clinical trials effectively, ethically, and in accordance with regulatory standards. Participants will acquire a practical understanding of:

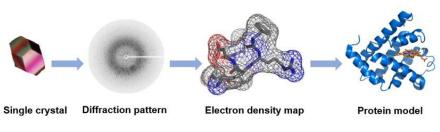

- FDA's approach to trial design
- Statistical issues in the analysis of trial data
- Safety concerns in the development of medical products
- Understanding preclinical information relevant to medical product development
- Clinical investigator responsibilities

The agenda is designed for clinical investigators, health care professionals (physicians, nurses, pharmacists, *etc.*), and individuals involved in biomedical research and the development of drugs and biological products. The course will take place on December 10-12th, 2024 via Zoom, between 11AM and ~ 4PM ET (17:30-22:00 in Switzerland). Information and registration:

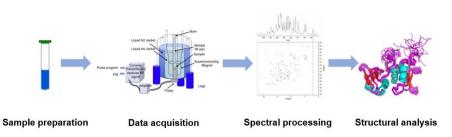

https://www.fda.gov/drugs/news-events-human-drugs/fda-clinical-investigator-training-course-citc-2 024-12102024

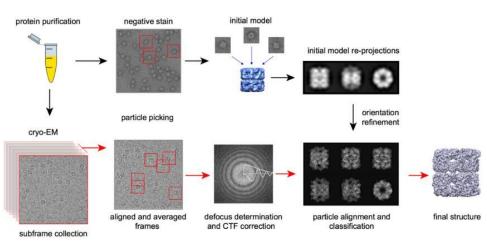

X-ray, NMR, and CryoEM are major experimental approaches to determining protein structures

X-ray crystallography

Nuclear Magnetic Resonance (NMR)

Cryo-electron microscopy (CryoEM)
